PART1

About Huawei ICT Competition

The Huawei ICT Competition 2026–2027 Global Final will be held in Shenzhen in May, 2027. The details of the competition are as follows:

Overview

The Huawei ICT Competition is an annual global event designed for students and teachers from colleges and universities. It offers an international platform for competition and exchange, enabling participants to strengthen their ICT knowledge, improve practical skills, and foster innovation using the latest technologies and platforms. Since its launch in 2015, the competition has been gaining significant momentum, with more countries and participants joining each year. In China, it has been listed as a national competition for university students, while globally, it has been recognized as a key partner flagship program by UNESCO's Global Skills Academy. The Huawei ICT Competition has been held 10 times. The 10th edition attracted over 220,000 students and teachers from more than 2,000 universities and colleges spanning over 100 countries and regions. Ultimately, 177 teams from 49 countries and regions advanced to the Global Final and received awards.

I. C. The Future

Objectives

Build a bridge to connect the world.

The competition is an international communication platform that connects Huawei, academia, and industries, as well as talent demand and supply. It helps colleges and universities cultivate ICT talent that is future-ready, along with promoting learning, teaching, innovation, and employment.

Build a stage to showcase talent.

The competition provides teachers and students an opportunity to showcase their talents to the world and at the same time win awards and honors. It also allows teachers, colleges, and universities to demonstrate the quality of their talent cultivation and extend their influence in the industry.

Build an ecosystem ready for the future.

The competition fosters effective teamwork between contestants and helps them build their creativity and entrepreneurship. Later on, these qualities will help them succeed in their chosen careers. Considering both economic and social value, the competition promotes the adoption of the latest ICTs (such as the Internet, big data, and AI) in production, education, research, and application. Participating countries and regions recognize the importance of investing in the ICT talent ecosystem, which leads to faster digital transformation worldwide. In addition, the competition promotes equal access to quality education and global digital inclusion. We hope that more people can benefit from the digital economy, and that we can build a better digital future.

Huawei ICT Competition 2026–2027 Guide

The Huawei ICT Competition 2026–2027 is divided into 7 main categories: Practice, Innovation, Programming, Challenge, Entrepreneur, Operator, and Teaching. Among them, the Programming and the Challenge Competition are available in the Chinese mainland and the Asia Pacific Region. the Operator Competition and the Entrepreneur Competition are available only in the Chinese mainland.

Practice Competition

- This competition features three tracks: Network, Cloud, and Computing. It assesses participants' knowledge of ICT fundamentals, hands-on technical skills, and teamwork capabilities. Participants are required to complete written and lab exams, with rankings determined by their overall scores. They are expected to have a solid understanding of relevant technical concepts and hands-on experience.
- Rules: The Practice Competition follows a four-level structure: National Preliminary, National Final, Regional Final, and Global Final. The National Preliminary and Final are assessed through written exams, while the Regional Final and Global Final focus on comprehensive lab exams.

Innovation Competition

- This competition focuses on evaluating participants' ability to apply AI and other ICTs to create innovative solutions. In accordance with the task requirements, participants need to use Huawei's AI technologies in combination with other technologies such as generative AI, big data, cloud computing, mobile Internet, and IoT to develop solutions that address real-world needs. These solutions need to demonstrate innovative application scenarios, commercial potential, and complete technical architectures. Alternatively, they can complete tasks such as AI training, inference, and agent development for specific industry scenarios.
- Rules: The competition follows a three-level structure: National Competition, Regional Competition, and Global Final. Teams need to submit related technical documents, code files, and a demonstration video. They also need to deliver onsite presentations in the Regional and the Global Finals.

Programming Competition

- Overview: The Cangjie Track, currently open only to the Chinese mainland and the Asia Pacific Region, evaluates students' ability to understand and apply the Cangjie programming language, including modern language features, AI and agent applications, and modern software engineering practices. The competition tasks align with current technology trends in the AI era and developer competency standards. With a focus on practical, open-ended challenges, the track encourages students to independently develop innovative solutions using advanced technologies.
- Process: The competition consists of three stages: National Competition, Regional Competition, and Global Final. It primarily focuses on hands-on programming. During the Regional Competition and the Global Final, participants may use AI tools for development and are encouraged to explore innovative applications.

Challenge Competition

- Overview: The Challenge Competition is currently open only to the Chinese mainland and the Asia Pacific Region. Participation in the Asia Pacific Region is by invitation only. It focuses on AI and high-performance computing (HPC) optimization using Ascend and Kunpeng platforms. It evaluates students' ability to optimize systems and algorithms on the specified computing platforms for HPC-AI convergence.
- Process: The competition consists of two stages: National Competition and Regional Competition. Each team must consist of 3–5 students from the same university and one instructor. During the National Competition, teams are required to submit technical proposals. In the Regional Competition, they will compete through software and hardware optimization within a specified time limit.

Teaching Competition

- The Teaching Competition focuses on the teaching and operational outcomes of ICT Academies and invites ICT Academy faculty members and administrators to submit representative cases that showcase their academy operation practices. The Teaching Competition aims to recognize outstanding examples, encourage the sharing of success cases among universities, and continuously improve the quality and effectiveness of ICT Academy operations.
- Rules: Participants need to submit their entries and deliver presentations.

Organization

Organizer

Huawei is hosting the Huawei ICT Competition and has established an organizing committee to handle all aspects of the event, including planning, preparation, implementation, review, and award presentation.

Co-Organizer

The Huawei ICT Competition is co-hosted by Huawei ICT Academies , who help with student training and participation organization.

Technical Support Platform

Huawei Cloud

Participation Requirements

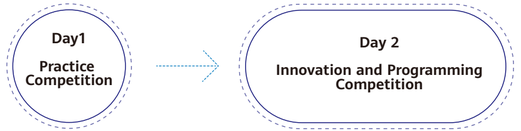

- Each participating team must include one instructor and up to three students, all of whom must be full-time university students at the time of registration.
- Contestants (except for the Teaching Competition) must have available PCs and Internet access. Each contestant can only participate in one track.
- To keep the competition fair and orderly, each participant must not register in multiple regions or countries.
- Grand Prize winners of previous global finals can participate in the competition again, but they must apply for different tracks.
- Entries must not contain any content that violates national laws and regulations, discriminates against gender, nationality, religion, or other related factors, or infringes on others' privacy. All inventions, patented technologies, and resources involved must have clear and legal intellectual property rights or ownership. It is prohibited to submit other competition entries without any improvements.
- All intellectual property rights for the entries belong to the participants. Participants agree to provide the competition organizing committee with the following rights at no cost, including but not limited to: reproduction, distribution (both print and digital), exhibition, educational training, screening, and online dissemination of the entries.

Schedule

Competition Time

The Huawei ICT Competition 2026–2027 Global Final is scheduled in May, 2027, including the Practice, Innovation, and Programming Competitions.

The competition sequence during the global final is as follows:

Awards

PART2

Huawei ICT Competition Guest Messages

Shafika Isaacs

Director a.i. of UNESCO Institute for Information Technologies in Education and Chief of Section for Technology and AI in Education

The future of AI requires collaboration among governments, international organizations, academia, and industry. Students in this year's competition demonstrated their ability to tackle real-world challenges across cultural boundaries by applying emerging technologies.

Hervé Huot-Marchand

Cheif of Section for Youth, Literacy and Skills Development in UNESCO

I would like to extend my deepest thanks to Huawei for organizing this ICT Competition and inspiring young people to connect and promote innovation on a large scale. I call on all of you to continue this important work to create value in our digital society paving the path for youth around the world to have a brighter future.

Borhene Chakroun

Director of Policies and Lifelong Learning Systems Division of UNESCO-HQ

Huawei ICT Competition is a testament to the result achieved and the incredible potential of our partnership. Our co-launching the dedicated Global Skills Academy & Huawei ICT Academy eLearning platform, which offers free certifiable training on digital technology, 5G, AI, Big Data and more in five different languages in supporting UNESCO's Global Skills Academy mission. Let me thank our colleagues at Huawei for their long-standing support.

Ge Siying

Deputy Director-General, Chinese National Commission for UNESCO

The National Commission of China for UNESCO supports Huawei's engagement in the global digital transformation of education with its unique strengths, and will continue working with global partners to make greater contributions to the promotion of digitalization in education worldwide and the achievement of prosperity for all.

Professor Mohan Munasinghe

Nobel Peace Prize Laureate in 2007, Blue Planet Prize Laureate in 2021, Former Vice Chair of the Intergovernmental Panel on Climate Change (IPCC)

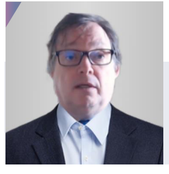

ICT has a key role to play in harmonizing the sustainable development triangle of economy, environment, and society. Digital technology will help boost productivity and growth, facilitate productivity and economic growth, and strengthen inclusiveness and cooperation. The Huawei ICT Competition encourages students to innovate and make critical breakthroughs that help achieve balanced, inclusive, and green growth globally.

Qin Changwei

Secretary-General, National Commission of the People's Republic of China for UNESCO

Huawei, as a leading global tech company, initiatives such as the ICT Competition have effectively cultivated and selected ICT talent worldwide, especially in developing countries, which demonstrates a deep integration of industry and education.

John Board

Dean of the Henley Business School, University of Reading

To Henley for such executive leadership programs, I'm very pleased to see that the collaboration with Huawei has been valuable and brought great benefits to students and to the local and international economy.

Reini Wirahadikusumah

Rector Institut Teknologi Bandung

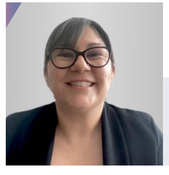

We have worked with Huawei for more than 10 years and it has become a mutually beneficial partnership. Together with Huawei, ITB always ensures that our students gain new insight into the latest technologies developed by Huawei.

Prof. Dr. Prof. h.c. Otthein Herzog

International Member of the Chinese Academy of Engineering

For most people working in ICT today and tomorrow, the emphasis of ICT applications has switched from algorithm development to the collection and representation of multi-modal application knowledge, be it by text documents, images, drawings, videos, or even 3D rendings. I foresee some years of fascinating development of LLMs, which certainly will capture the imagination of many scientists, thus improving tools that are already very powerful today.

Jenifer Castillo R.

IEEE Women in Engineering Committee Chair 2021 - 2022
IEEE Region 9 Director Elect 2022 - 2023

In the Huawei ICT Competition, Awards are great tool to support the recruitment and retention of women and girls in information and communication technology fields.

PART3 Huawei ICT Competition Winner Show

From Ideas to Impact: Building an AI-Powered Drone for Safer Power Line Inspections at WHUT

When we registered for the 10th Huawei ICT Competition, we kept asking ourselves one question: Could the model we'd been training in the lab really work when we connected it to actual drone? We wanted to help power line workers by making a drone that could take over their most dangerous inspection tasks. We spent months preparing and iterating our solution before we finally had our answer: Using Huawei's MindSpore framework we COULD have drones take on high-risk inspection tasks. We had done it.

We chose power line inspection as our project focus because it combined technical challenges with real-world significance. Traditionally, power line inspections are very labor intensive. They are very inefficient, and also expose inspectors to high-risk environments, since they are working high up with live electrical equipment. More importantly, conventional visual inspections can only identify physical damage on the surface, missing a lot of internal faults that could lead to catastrophic overheating. We wanted to build a system that could see both the outside and the inside. For months, our lives were filled with late-night coding sessions as we set up test environments, collected data, designed networks, compressed the model, deployed it at the edge, and conducted outdoor flight tests. Every time our drone crashed, we had to start over. There was no ready-made solution for us to follow, so we built our own approach step by step. There weren't mature flight paths we could reference either, so we had to take our drone into the field and test it repeatedly under different conditions. Our instructor often reminded us: "Don't be satisfied with a model work just built on public datasets. Real-world capability is built with real-world equipment, real-world scenarios, and real-world constraints." This principle helped us stay focused through every round of testing and iteration.

From Classroom Learning to Hands-On Practice

The framework we used for this project was Huawei's self-developed AI framework, MindSpore. To be honest, before this competition, we were more familiar with widely used international deep learning frameworks that were referenced in our deep learning courses, largely because of the fact they had extensive tutorials and mature ecosystems. This time, however, we used MindSpore to tackle a real engineering challenge. We were able to get hands-on experience with this framework's entire development process, from data loading and model training to model pruning, quantization, and edge inference. The fact that this framework was fully domestic had unique advantages for us, and it's been fascinating to watch its rapid evolution. MindSpore is not perfect, but it is growing rapidly and specificallyaligned with the development scenarios we see locally. This helped us better understand technological self-reliance, beyond just being an abstract concept. It is clearly reflected in every training curve, optimization cycle, and deployment test we conducted.

Our confidence in taking on this project also came from the laboratory resources provided by our university. Every member of our team initially joined our instructor's lab because of our interest in computer vision. The first time we saw a real drone, we were so excited by the possibilities that the physical device could bring. Computer vision is going far beyond just analyzing pictures. We began to think about how we could improve the drone's "eyes" through code and enable it to recognize power lines autonomously. What impact could that create for society? However, passion alone was not enough to turn an idea into reality. What truly transformed our observations into practice was the university's systematic training and coursework.

In our Computer Vision course, the instructor designed hands-on projects based on MindSpore, guiding us from image classification to object detection, gradually helping us understand the framework's APIs and features. In our Deep Learning Systems course, the instructor helped us dig deep into how static and dynamic computational graphs work, as well as the underlying principles of operator compilation optimization. These classroom experiences, combined with easy access to drone hardware in the lab, helped us build our confidence for the competition. We knew where we were going to start and how to approach complex challenges. We didn't have to blindly experiment from scratch.

Turning Engineering Challenges into Solutions

When we registered for the competition, we knew it was going to be challenging. But once we started working on the project, we realized that it was going to be far more complex than we had imagined. Drone-based power line inspection may sound straightforward; but in practice, it involves many complex engineering problems. Outdoor lighting conditions can change rapidly, and thin power lines are difficult to distinguish against complex backgrounds. Even more challenging is that the drone, as an edge device, has extremely limited computing capacity and power resources, which makes it difficult for conventional large-scale models to run in real time. Early on in the project, we fell victim to a common misconception that the latest and most complex network architectures would be what we needed. In the end, we realized that the best and biggest model was too large for our edge devices to handle.

Whenever we found ourselves struggling to move forward, our instructor didn't swoop in and fix the code for us. Instead, he stood by our side and reminded us: "Engineering is not about showcasing technology. It is about starting with the actual problem, breaking it down to understand its components, and finding a solution that truly fits the needs."

His reminders would help us take a step back, rethink the challenge, and refocus on the core problem. We needed to focus on what kind of solution would truly fit real-world inspection environments.

Based on this perspective, we designed a collaborative edge-cloud-network system. In simple terms, we enabled the drone to complete most detection tasks independently, but complex cases beyond its capability would be sent back to the cloud for further analysis. We addressed the drone's limitedcomputing capacity by equipping it with an edge computing device powered by Ascend chips. These chips served as an additional "brain" that allowed it to operate independently without relying on network connectivity. This would enable the drone to conduct inspections even in remote mountainous areas or disaster scenarios where communications are unstable. It also significantly reduced the bandwidth we would need for data transmission. The original model was also unfortunately too large to run efficiently on edge devices, so we compressed it and simplified the detection network architecture, reducing the model size and complexity while maintaining smooth on-device performance. We also leveraged MindSpore's inference acceleration capabilities to ensure efficient performance after compression.

The Wuhan University of Technology Team (left) alongside other winners receiving the Grand Prize at the Global Final of the 10th Huawei ICT Competition

Since power lines are extremely thin and insulators are often very small, conventional detection methods could easily miss subtle defects. We improved the model's sensitivity to small targets, allowing it to identify these minor anomalies more effectively. The most important step we took in the end was moving beyond relying only on visible-light images by integrating infrared thermal imaging. After aligning and fusing the two types of images at the pixel level, our system could capture both visible physical damage and signs of internal overheating that are invisible to human eyes.

To fully validate our algorithms before real-world flight tests, we built a high-fidelity simulation environment that recreated drone flights across different terrains and lighting conditions. After validation simulations, we took it one step further by designing an intelligent task allocation strategy: The lightweight model handled most routine scenarios directly on the drone, while uncertain and complex cases were sent back to the cloud for further verification. This approach allowed us to maintain both fast onsite response and reliable detection accuracy.

By the end of this journey, we were no longer just users who could run existing models. We had developed the ability to take a real-world problem and design for it flexible solutions that met actual needs.

Testing Innovation on the Global Stage

Before we started our project, we divided our responsibilities clearly: One focused on algorithm design and optimization, another took over model conversion and edge deployment, and the third was responsible for the flight control system and end-to-end integration and testing. Initially, we hit quite a few speed bumps trying t decided a new SOP: After every field test, no matter how late it was, we would immediately review the results. We looked beyond detection accuracy and analyzed the root causes of each detection failure: Was it caused by changing lighting conditions or drone vibrations? We then continued optimizing throughout the night and tested again the next day.

After multiple rounds of training, deployment, flight testing, and review, we began working together more effectively, and our processes became much more efficient. Eventually, we got the entire system running successfully. The drone achieved real-time inference at 26 frames per second, with an overall detection accuracy of 97.8%. This meant that the drone could complete most inspection tasks during flight, while only a small number of complex cases required additional verification from the cloud. The value of our solution soon became clear. With our system, the drone could take on challenging inspection tasks in high-altitude environments and near live power lines, reducing the need for inspectors to climb high-voltage towers and work in hazardous conditions. In remote mountainous areas or locations where communications were down after natural disasters, the drone could independently identify potential risks without requiring network transmission. At the Global Final, our drone took off smoothly. As the large screen at the Global Final venue displayed accurate real-time detection of winding power lines, we saw all the late nights, the experiments, and the iterations turn into a moment of achievement.

Three Lessons Beyond the Award

Standing on the award stage, we were bursting with that pride. Beyond the award itself though, the most valuable part of this journey has been the three things we've learnt.

First, we've gained a deeper understanding of the real-world value of domestic AI frameworks. Throughout the project, we did more than simply use the framework in our courses and competition. We were also able to become active contributors to MindSpore—and the domestic AI ecosystem—by working with Huawei's team to share our feedback on issues we found and suggesting improvements.

Second, we gained a deeper understanding of problem-oriented engineering as a whole.

Third, we proved to ourselves that young innovators have the practical capabilities to impact the world.

The 10th Huawei ICT Competition has come to an end, but for us, the real journey is just beginning. From the laboratory to the award stage, and from lines of detection code to a drone capable of autonomous inspection, this experience taught us one important lesson: Innovation does not exist only on paper or in presentations. It is built with every takeoff, every failure, and every attempt to rise again. With this experience, we will continue moving forward and exploring how technology can be applied to solve real-world challenges and create value where it is needed most.

Innovation Lighting the Way Forward – Central China Normal University

At the Central China Normal University (CCNU), a group of students have earned recognition on the Huawei ICT Competition global stage. They spent long nights fine-tuning their devices and refining their proposals, working until each detail was right. Their dedication earned them both the global Grand Prize and Third Prize in the innovation track. In 2025, their hard work rewarded them. Some were recommended directly for doctoral study at the Zhejiang University. Some secured places for postgraduate study at the Beijing Normal University and the Institute of Automation of the Chinese Academy of Sciences, while others still were recommended for advanced study at the Fudan University, Xiamen University, and Northwestern Polytechnical University. They have all set out on the paths they chose, moving steadily toward their dreams.

Behind this journey lies the students' hard work and perseverance and their instructors' unwavering dedication. The torch, passed from one group of contestants to the next, continues to light the journey of generations of ICT students as they set out in the pursuit of glory.

Industry-Education Collaboration: Opening New Doors

In 2017, CCNU and Huawei started collaborating on talent development. They jointly established a talent cultivation innovation center, developed courses, introduced technologies, and trained instructors. Through these initiatives, CCNU and Huawei aimed to promote a new model of engineering education that combines curricula, practices, and competitions, igniting the first spark in cultivating innovative ICT talent.

In 2020, CCNU established the Huawei Base Class, implementing a mentorship system at the undergraduate level where each mentor guided 2 to 3 students. These mentors assisted students in research training, academic competitions, and innovation projects, helping them use what they learned in class in practice. From the classroom to the lab, from textbooks to competition arenas, students in the Huawei Base Class have carried the torch forward year after year.

What began as a spark has grown into a steady light, passed from one team to the next.

A Spark Ignites, Lighting the Way to Progress

In 2021, the year after the Huawei Base Class was established, the 6th Huawei ICT Competition kicked off. The students of the Class made their debut in the innovation track, winning a global Third Prize and the TECH4ALL Honorary Award. It was their first time transforming the knowledge they had learned in class into innovative projects and stepping onto the international stage. At that moment, the university's name – CCNU – was shining brightly on the global podium.

As time passed, an all-female team of CCNU took up the mantle from their seniors and participated in the 8th Huawei ICT Competition. They focused on smart agriculture and developed an intelligent inspection robot for crop patrol and disease recognition. To bring this project to fruition, they delved deeply into Huawei's technologies, including the Atlas main control board, the openEuler operating system, and the MindSpore architecture. During the preparation phase, they spent countless hours in the laboratory, refining algorithms, fine-tuning equipment, and improving their plans. They burnt the midnight oil in the university labs on the regular. They were so absorbed in the experiments that they risked staying beyond their curfew and being locked out by the dormitory supervisors. Over the Qingming holiday, they basically lived in the lab, meticulously refining code and adjusting the robot's assembly to ensure every detail was exact and error-free.

After months of late nights, trial runs, and determination, their moment on the podium made it all worth it. With their smart agriculture robot, the team won the global Grand Prize in the Innovation Competition – setting a new record for their university. Wang Rong, Wang Yiting, and Peng Ruofei showed that when you stick with an idea, push through setbacks, and keep building, even a small spark can grow into something extraordinary.

Another team from CCNU, comprising Wang Qingyan and Tan Tingting, won a global Third Prize in the Innovation Competition of the 8th Huawei ICT Competition. Their project focused on a smart medical consultation system using MindSpore, aiming to provide community users with AI-based common disease diagnosis, over-the-counter treatment options, and first aid Q&A services.

The Grand Prize winner team members preparing for their presentation in the Innovation Competition of the 8th Huawei ICT Competition (From left to right: Peng Ruofei, Wang Rong, and Wang Yiting)

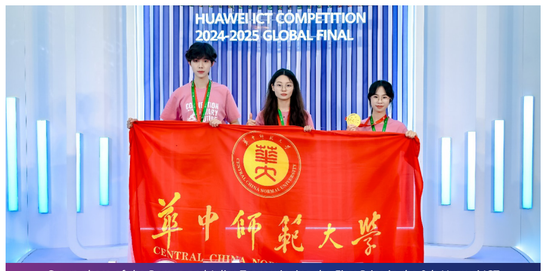

The two teams, with different projects, both brought honor to their university. Through their actions, they sparked a belief in those who followed: to keep moving toward the light, no matter how distant it may seem.

Carrying the Torch, Advancing Toward Innovation

When the competition ended, news of the seniors' win swept through campus. For many younger students, it wasn't just exciting – it was inspiring. Among them was Zhu Bing, a member of the team preparing to attend the 9th Huawei ICT Competition. The news lit something in her.

"I was stunned," she said, thinking back to the moment she heard the seniors had won the global Grand Prize. "But more than that, I felt a kind of admiration. I'd seen them every day – heads down, working late, pushing through. That image stuck with me. I wanted to be like them. I wanted to stand somewhere higher, where my work could be seen and maybe even matter."

In 2024, Zhu Bing teamed up with Yu Xing and Luo Nan (team name: Romeo and Juliet) and registered for the 9th ICT Competition. From the preliminary to the Global Final, from theory to practice, Zhu Bing witnessed her project gradually taking shape based on her academic knowledge. They developed an intelligent wearable assistive device for the visually impaired, addressing daily travel and accessibility in public service venues. This system integrates AI vision, BeiDou positioning, and sensor fusion algorithms to help overcome the challenges faced by the visually impaired when traveling, contributing to the construction of a barrier-free society. During the final preparation phase, the team worked tirelessly day and night to debug the equipment. "We devoted ourselves completely, both physically and mentally," the team recalled. Despite the fatigue, they felt a deep sense of achievement and pride.

Group photo of the Romeo and Juliet Team winning the First Prize in the 9th Huawei ICT Competition Global Final (from left to right: Yu Xing, Luo Nan, and Zhu Bing)

Although they did not surpass their seniors' global Grand Prize, they still won the First Prize at the Global Final. Zhu Bing said: "This competition really opened my eyes to how powerful our knowledge can be when it's applied in real life. I realized that learning isn't just about personal growth – it's also about making a real difference in the world." This achievement not only signifies their personal growth but also carries forward the spirit of perseverance demonstrated by their seniors.

Steady Steps Toward a Brighter Path

Over the years, from the 6th to the 9th editions, several teams have stepped onto the global stage, striving hard and bringing glory to their university. Additionally, they have also made impressive personal achievements. Peng Ruofei has been recommended directly for a doctorate at Zhejiang University. Wang Yiting and Wang Rong have secured places for postgraduate study at the Beijing Normal University and the Institute of Automation of the Chinese Academy of Sciences respectively. Tan Tingting and Wang Qingyan have been recommended for further study at Xiamen University and the Northwestern Polytechnical University. The students of the 9th edition continue to grow and succeed through their efforts.

Their story is more than just their achievements; it is a vivid testament to CCNU's initiatives on industry-education collaboration and promoting learning through competition. At the Huawei Base Class, CCNU employs a talent cultivation mechanism that puts in place a class advisor, a deputy class advisor, and program mentors. Outstanding faculties are selected as class advisors, while experienced engineers or managers of Huawei serve as deputy class advisors. CCNU and Huawei jointly developed 21 courses covering cutting-edge technologies such as artificial intelligence, cloud computing, and deep learning. CCNU has regularly hosted Huawei ICT practical classes and bootcamps, achieving a seamless integration of courses, practical training, research, and competitions.

In those years of relentless hard work, there were moments of uncertainty, times when it all seemed overwhelming. Yet, year after year, competitors passed the torch, each step resolute, each stride unwavering. The sparks of perseverance they ignited now converge into a guiding light, illuminating the path ahead.

Today, the torch is passed to a new intake of students, each embarking on their own journey of youth and discovery. As Zhu Bing once said, "The most difficult hour is just before success, and every challenge brings us closer to a new beginning."

United Across Universities: How the Tanzania Team Took Home the Grand Prize

By: Vida Mapunda (Dar es Salaam Institute of Technology), Sigfrid Michael (University of Dodoma), and Joseph Msuya (University of Dar es Salaam), teammates and winners of the Grand Prize

In May 2025, at the award ceremony of the 9th Huawei ICT Competition Global Final in Shenzhen, we proudly claimed the Grand Prize in the Network Track for our home country, Tanzania. As the thunderous applause and cheers filled the hall, our faces lit up with joy and accomplishment. This edition saw over 100,000 participants globally in the Network Track alone, making the competition incredibly fierce. To prepare for this challenge, we spent countless late nights delving into network knowledge and technologies through the Huawei Talent platform. We honed our practical skills using the eNSP simulator and collaborated remotely via online meetings. Grounded in technical expertise, strong teamwork, and relentless perseverance, our journey culminated in a significant transformation.

The Tanzanian team (the second from the left) winning a Grand Prize in the Network Track of the Practice Competition at the 9th Huawei ICT Global Competition Final

How It All Began: Three Strangers, One ICT Dream

We come from three different universities in Tanzania: I, writing, am Vida Mapunda from the Dar es Salaam Institute of Technology, and my teammates are Sigfrid Michael from the University of Dodoma, and Joseph Msuya from the University of Dar es Salaam. The Huawei ICT Competition brought us together, forming a unique team of strangers.

When we registered for the Huawei ICT Competition, we had no idea how profoundly it would shape our understanding of networking and technology. The Network Track covers three major areas: data communication, security, and WLAN. Initially, these technologies were merely formulas and concepts in our textbooks, but the Huawei Talent platform transformed our learning experience entirely.

The platform provided us with a wealth of certified learning materials, including lab exercises, exam outlines, video tutorials on key topics, and exam questions of past competitions. These resources helped us develop practical, real-world skills and instilled in us a new mindset, one of self-driven learning and problem-solving.

On this platform, Huawei offers a clear and tiered certification pathway, from Huawei Certified ICT Associate (HCIA) to Huawei Certified ICT Professional (HCIP) and Huawei Certified ICT Expert (HCIE). These certifications cover specialized areas such as data communication, security, WLAN, and data center networks, and represent a structured progression of knowledge and hands-on expertise.

The platform also equipped us with the ability to solve problems independently. Instead of relying only on our instructors, we began exploring topics independently using video tutorials to clarify difficult concepts and past exam papers to test our understanding. We spent countless hours running simulations, processing configurations, and even competing using practice tests to measure our readiness. This shift from passive learning to active experimentation was exciting.

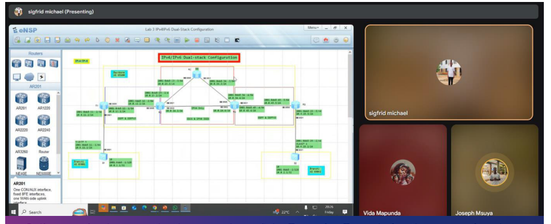

Networking was no longer just a subject to study for exams; it became a skill to master, a puzzle to solve, and even a potential career path to pursue. The most significant change was regarding how we perceived networking as a whole; through Huawei's resources, we began to see it as a living, evolving field with direct industry relevance.

Collaboration: Two Cities, One Heartbeat

Forming a team is one thing, but effective collaboration is quite another. As a three-university alliance, we faced significant real-world challenges, including geographical distances and conflicting schedules, which made face-to-face interactions particularly tough. However, where there is a will, there is a way. We held online meetings to bridge the distance. Every evening, our online meeting room turned into a command center where we practiced configuring routers, switches, access controllers, access points, and firewalls together. Every call to check on each other's progress remains vivid in our minds.

Beyond our collective online learning and discussions, we sought guidance from previous Network Track winners from Tanzania and our mentor, Eng. Ally. Their advice provided invaluable direction and support throughout our preparation.

This unique experience of preparing across different locations taught us that real teamwork is not about being in the same room – it is about working toward the same goal, with mutual trust. It was this spirit of unity, transcending campuses and cities, that ultimately allowed us to shine brightly on the global podium in Shenzhen.

Online meeting between the three members of the Tanzanian Team during the preparation phase

Showdown: Eight Hours of Competition, A Lifetime of Glory

In May 2025, we arrived in Shenzhen, China to start our memorable journey of the Global Final. On May 20, we attended the opening ceremony where we walked the red carpet and took the oath alongside other finalists. We pledged to a fair competition and committed to giving our all.

An even more unforgettable experience was the lab exam. The final lab exam was like a marathon – an intensive 8-hour exam. To make every second count, we worked tirelessly for eight hours without even breaking for lunch. When that final ping test succeeded, our fatigue faded fast – replaced by a quiet thrill of knowing we'd done something remarkable.

At the award ceremony on May 26, when the host announced the Grand Prize winners for the Network Track, the word Tanzania echoed through the venue. We held our national flag high and stood on the podium, cheering and celebrating. A deep sense of pride filled our hearts. At that moment, we felt more strongly than ever that technology has no borders, yet ambition is deeply rooted in where we come from.

Tanzanian Team ready for the competition of the Network Track

To Those Who Chase the Light: A Stage for Us All

Through the competition, we gained access to advanced technologies driving global connectivity and hands-on practice with real-world solutions. This experience also expanded our understanding of how these technologies are deeply applied across various industries. Converting theory into practice during the competition not only improved our technical skills but also cultivated a systematic approach to solving complex engineering problems, which elevated our expertise to new heights. Winning the Grand Prize not only strengthened our resumes – it also gave us a real sense of confidence about the future.

Perhaps the most valuable gift was the deep friendships we established with other contestants from around the world. Through cultural exchanges, we shared the educational values and life wisdom of our respective countries. Through technical collaboration, we sparked innovative ideas through open discussion and hands-on problem-solving. These connections – no matter where we came from – have expanded our horizons in the way we never imagined.

If you, too, dream of a future in ICT, the stage is open for you – the 10th Huawei ICT Competition is now officially underway. It does not matter where you start; what matters is how much you are willing to invest. Make the most of the learning resources offered by Huawei, commit to hands-on practice every day, and seek out like-minded peers – even if they come from different cities. This platform always keeps the lights on for those who persevere.

Brighten Digital China's Way with Smart Transportation

The 7th Huawei ICT Competition brought together talent from various fields and set up the smart road track, in which contestants demonstrated just how vast the possibilities of smart transportation are.

Tsinghua University's imin team won the Smart Road Track Grand Prize in the Huawei ICT Competition 2022-2023 Global Final.

In May 2023, my friends Zheng Chenhao and Chen Duowen and I went on stage to receive the grand prize of the 7th Huawei ICT Competition. We had received other awards before, but this time was different — there were colorful flags from all over the world, contestants were cheering, and I was blown away by the electric atmosphere. Winning the grand prize has filled me with pride and a new found confidence in my studies.

I have seen Huawei ICT Competition listed amongst national college student competitions released by the Chinese Association of Higher Education. Huawei ICT Competition is an international event that serves as a platform for students to showcase their talents, exchange ideas, and make new friends. However, thinking back to the real reason I decided to sign up, I saw it in a promotional article I came across by happenstance in November last year, and the advert got me interested in the format of the competition. One of the topics of the smart road track — "congestion management detection, optimized management, and simulation research based on vehicle trajectory big data" — also caught my eye as it is strongly related to my own research topic "urban traffic signal management". It was then that I ran the idea past Zheng Chenhao and Chen Duowen and we shared our hopes of signing up for the competition in our subject group. The notion received strong support from our instructor, Professor Li Ruimin, and thus our team was formed.

After signing up for the competition, we were so impressed to see that Huawei provided each team with the holographic data of an intersection. The data included map and vehicle data like vehicle identities, attributes, speed, spatial and temporal locations, and driving status. This was all generated by Huawei using radar, video, high-precision maps, edge computing, and other cutting edge technologies. This was game changing for us. In our usual research, we would rarely come into contact with real, actual data. This enabled us to have a better understanding of actual engineering problems and real city management, which can help us propose more feasible, practical, and economical technical solutions to truly improve infrastructure construction and the travel experience of urban residents.

Come up with solutions and pursue excellence

During the preparation process, we were having endless discussions and conducted reams and reams of analysis. We tried and tested all kinds of methods and solutions.

Our topic was "how to solve vehicle queuing and congestion during peak hours for more accurate, smarter, and more practical traffic sensing and management".

Under the guidance of Professor Li Ruimin, we found a method to extract trajectory data based on key location points and identified the key requirements of intersections. We analyzed features of road traffic flow, proposed a distributed control method supported by real-time detection data, and built a practical algorithm implementation framework. Based on simulation experiments, we analyzed the comprehensive performance of the algorithm and verified the adaptability and effectiveness of the method in vehicle congestion management.

To come out on top in the competition, it's not enough to just offer workable solutions; we needed to present our entry and articulate its value to win the recognition of judges. Seneca once said that "luck is what happens when preparation meets opportunity", and that is absolutely true. We practiced and practiced. Before our official oral defense was due, we went to the Huawei campus to find out about the competition environment in advance and get rid of some of the tension we had built up. On the big day, we successfully presented our solution and managed to give impressive responses to the judges' questions.

The award ceremony was held On May 27. We were both nervous and excited as we waited for the winners to be announced. When I heard the name of our team, my eyes welled with tears, and the cheers of the crowd rang in my ears. All of our hard work over the past six months had paid off, and in that moment, everything was worth it.

Industry Competition-Smart Road Track of Huawei ICT Competition 2022-2023 Global Final

The award ceremony was held On May 27. We were both nervous and excited as we waited for the winners to be announced. When I heard the name of our team, my eyes welled with tears, and the cheers of the crowd rang in my ears. All of our hard work over the past six months had paid off, and in that moment, everything was worth it.

Strive for a bright future

Through the competition, we were able to compete with global participants, make new friends, and broaden our horizons to learn about the latest technologies and industry trends. It not only developed our professional skills and problem-solving capabilities, but also provided inspiration for our future career development. I will definitely recommend the Huawei ICT Competition to my peers.

According to China's 14th Five-Year Plan for Digital Transportation, by 2025, transportation facilities will be digitally sensed, information networks will be widely covered, transportation services will be more convenient and intelligent, and industry governance will be digital, collaborative, and integrated with applications that have a robust network security.

As a student of Tsinghua University, I always keep in mind the school motto of "self-discipline and social commitment". The purpose of learning and delving into technology is not only for the future of my own, but also for the needs of national development. As a member of the transportation research team, I also hope to make contributions to smart transportation. In the future, my teammates and I will build on the research results of this competition and continue to improve our solutions by adding richer data and engineering scenarios to create a safer, more efficient, and sustainable urban transportation system for China.

> "It not only developed our professional skills and problem-solving capabilities, but also provided inspiration for our future career development."

Chongqing University of Posts and Telecommunications' First Global Triumph: How Competition Became the Bridge to Glory

In May 2025, the Huawei ICT Competition 2024–2025 Global Final came to a close, with Chongqing University of Posts and Telecommunications' team taking home the Global Grand Prize for the first time in its history – a new milestone in its competitive record. Behind this honor stands an ICT Team forged over a decade of rigorous training and real-world practices. Their journey is a testament to the power of competition to cultivate both knowledge and talent.

It is also the fruit of deep-rooted collaboration between university and industry. Built on the talent development platform co-created by Huawei and Chongqing University of Posts and Telecommunications (CQUPT), the team has steadily advanced a practice-oriented training system – bridging the gap between theory and application. Today, some team members have earned early admission to top-tier universities through their standout performance in competition; others have gone on to join Huawei, contributing to the ICT industry. The trophy marks more than a first-ever victory on a global stage – it reflects a talent pipeline shaped by university-industry collaboration and the passion that comes with gleaming under the competition spotlight.

A Decade of Effort: From Passion to the Podium

In 2015, Professor Ming Yan, the instructor of the team, led her students in participating in the first Huawei ICT competition. Although they did not advance beyond the provincial level, this experience ignited the fire for industry-education collaboration and learning through competition at the university. The ICT Team was then established in October of that year. The first recruitment attracted only 50 students, who, under the guidance of Professor Ming, participated in various technical competitions both inside and outside the university. None could have predicted that this little-known student society would stand on the world stage a decade later.

Since then, the team has consistently achieved breakthroughs on the competitive stage: In the Huawei ICT Competition 2022–2023, they secured their first Global First Prize in the Cloud Track, with a team member Shi Jiaying being admitted to Zhejiang University for further studies, and another member He Mingze to the University of Chinese Academy of Sciences. During the Huawei ICT Competition 2023–2024, they won another Global First Prize in the Cloud Track and a Global Third Prize in the Computing Track. In the Huawei ICT Competition 2024–2025, they reached their ultimate goal in a blaze of glory with a Global Grand Prize in the Ascend AI Track and a Second Prize in the Computing Track.

This team is not only a winner of medals but also an integral part of the talent development system. Through continual exploration of the academia-competition-employment pipeline, the team has bridged the gap between classroom instruction and industry practice, becoming a cornerstone of the university's initiative.

Every competition fosters learning. Every challenge fuels growth.

Lei Yuhang, an undergraduate student majoring in Communication Engineering, Class of 2022, served as the captain of the ICT Team in 2024. He was one of the earliest students to engage with the Huawei ICT Competition, joining the team in 2023. His first attempt at participating in the competition, where he registered for the Network Track, ended at the provincial level. In 2024, he started to lead the team and helped members learn and grow.

He remarked, "When I became the captain, the competition became more than just a challenge – it became a responsibility." Leveraging his extensive knowledge of AI theory accumulated through his studies, he decisively chose the Ascend AI Track for this year's competition.

Dong Junhong, an undergraduate student majoring in Electronic Information Engineering, Class of 2022, first came across the Huawei ICT Competition in the university's postgraduate recommendation documents. It was noted in the documents that participating in this competition could earn bonus points for the admission to postgraduate studies. "I just wanted to give it a try at the time," he said. Another team member, Li Ruihong, joined the preparation team under similar circumstances – as a student majoring in Information Engineering. His initial goal was to gain knowledge about AI and boost his chances for postgraduate recommendation.

"While everyone was out enjoying themselves during National Day, I stayed in my dorm room to review theoretical knowledge points. On New Year's Eve, I was still coding alone." These everyday yet touching moments vividly capture their dedication and perseverance throughout their preparation.

The CQUPT has established a systematic mechanism for theoretical study and the practical training of competition teams. Self-study during holidays, real problem-solving exercises in their spare time, and team coordination have become integral parts of their routine. They devoted countless hours in between classes to meticulous practice – working through past competition problems and refining their teamwork through repetition.

As training progressed, the students gained more than just hands-on experience with the Ascend platform. They gradually developed a mindset rooted in engineering AI algorithms and cultivated a strong sense of collaboration. In the end, what they took away was more than a top prize. Dong Junhong reflected, "I didn't know much about AI before. But now, I feel confident navigating these domains on my own."

Li Ruihong, meanwhile, expressed a clear sense of purpose: "I want to pursue graduate studies in AI."

Their story shows that the journey toward something greater is rarely defined by dramatic moments, but by quiet persistence – by learning, laboring, and showing up, day after day.

Promoting Learning Through Competition: She Mentored the Team Towards Broader Horizons

The Huawei ICT Competition is not an isolated competition but a bridge connecting teaching, research, and employment at CQUPT. In 2015, Professor Ming established the ICT Team, taking charge of student selection, course instruction, and hands-on project training. Over the years, she has dedicated her spare time to guiding students through both theoretical lessons and practical drills, gradually developing a systematic training framework for competition preparation. Under her leadership, the team has become a talent incubator where outstanding students continue to emerge.

Behind every team advancing to the global finals in past editions of the Huawei ICT Competition stands Professor Ming. From their initial provincial debut to claiming a place on the world podium, she has accompanied the students with steadfast commitment and sustained dedication – guiding them steadily from first-time entrants to global champions.

Over the past decade, the ICT Team has enrolled more than 600 students, with over 100 achieving Huawei certifications. Many have leveraged their solid expertise to reach broader horizons: Participants in the Huawei ICT Competition 2022–2023 gained guaranteed graduate admissions at Zhejiang University and the University of Chinese Academy of Sciences; those in the Huawei ICT Competition 2023–2024 secured places at the Beijing University of Posts and Communications, University of Electronic Science and Technology of China, or continued graduate studies at their home institution.

These accomplishments attest to the university's effective approach of "learning through competition, fostering talent through competition". Generations of students have come to understand that true growth arises from persistent effort, and that dedication inevitably bears fruit.

At this year's Huawei ICT Competition China Final, Secretary Li Lin and other senior leaders of CQUPT attended both the event and awards ceremony. Their presence not only offered powerful encouragement to the ICT Team's faculty and students but also reaffirmed the university's firm commitment to "learning through competition" and "university-industry talent cultivation".

A Decade On, the Journey Begins Anew

As the Huawei ICT Competition marks its tenth year, CQUPT has presented an impressive answer sheet – one that closes a chapter for its competition team while opening the door to new aspirations. Behind this achievement lies the shared pursuit by both faculty and students of using knowledge to serve the nation and capabilities to meet industry needs.

At CQUPT, every student has the chance to grow – from humble beginnings to emerging as a rising star in technology. Every competition becomes a step toward personal and professional growth. Every breakthrough reflects the power of school-enterprise collaboration in nurturing talent. Ten years of perseverance have become the best testament to staying the course; this journey of striving will remain a beacon for generations of ICT students.

As the future takes shape, a new chapter unfolds. The next decade is already on its way –steadily, and full of promise.

A Path Beyond Definition: The Journey of an ICT Youth Breaking Boundaries

Not a prodigy, but diligent.

Not the fastest, but relentless.

Not from a top school, but standing on the global stage.

In two years, he earned four Huawei certifications across distinct technical fields.

In three competitions, he mastered three tracks—cloud, computing, and Ascend AI—winning twice at the top, once close behind.

No single label fits. No singular explanation defines him.

This is Liao Anjie—a young ICT student still pushing the limits of his own potential.

Where the Dream Began: From an Uneven Start to an Unfolding Journey

Liao Anjie's path through education was not a walk in the park. In middle and high school, his grades remained modest, each exam seeming to reinforce the label that he simply was not "made for studying." From numbers alone, he was not seen as a top prospect by his teachers, nor was he counted among the high achievers by his peers.

But the reality was more complicated. He was never lacking in ability. As early as junior high, he had won a championship in the National Youth Educational Robotics Olympiad, showing a rare aptitude for hands-on problem-solving and logical construction. Yet these strengths found little space to develop, gradually stifled under the weight of grades and the quiet anxiety they carried.

In 2021, he entered Nanning Polytechnic (now Nanning University of Technology) to begin his college life. This time, he chose not to fight his academic imbalance, nor to chase the fleeting validation of test scores. Instead, he began to search for a direction that felt truly his own—and this campus became the place where he could march to the beat of his own drum.

Soon after arriving, by chance he learned that the school had won second prize nationally and third prize globally in the sixth Huawei ICT Competition. It was a revelation: that people from places like this could stand on a global stage. Technology, he realized, was not the preserve of the gifted few—it was a language that belonged to anyone willing to learn it.

Breaking Through: Four Certifications in Two Years and a Hard-Earned Turning Point

Once the spark was lit, the real challenge began. Liao Anjie knew well that enthusiasm alone would not be enough to gain a foothold in the ICT field; the gaps in his technical foundation were too wide to ignore. He resolved to start from the ground up—with basic certifications that would force him to build a systematic understanding of the field.

As a student majoring in big data, he chose cloud computing as his entry point. But this,17 proved no easy path. Concepts like virtualization, resource pooling, and automated management were dense and technically demanding. Even a small error in a lab setup could bring down the entire environment, requiring a complete rebuild.

Drawing on materials from the Huawei ICT Academy, he spent long hours watching course videos, running experiments, and searching for answers to unfamiliar problems. After ten months of steady study and preparation, he earned the HCIE-Cloud Computing certificate—the highest-level expert certification in Huawei's system and one of its most difficult, with a low pass rate. The exam tested not only theoretical knowledge but real-world deployment and problem-solving skills—a comprehensive trial of ability, mindset, and perseverance, especially for a student starting from a vocational college background.

With the cloud computing certification in hand, he set an even stricter learning schedule, branching into multiple technical fields. The curricula differed, the systems conflicted, the simulations failed again and again—but he persisted, refining his approach through repetition and review. Over the next year, he went on to earn three more certifications: HCIA-openEuler, HCIA-AI, and HCIP-Storage.

These certificates were not simply shiny trophies for a display cabinet. They symbolized hundreds of hours of effort, and marked milestones on a steep and solitary climb. In the process, he built not only technical skills but a lasting sense of discipline, self-direction, and confidence.

"I may not be the fastest," he says, "but I try never to stop moving forward."

Four Competitions, Four Victories: From Competitor to Guide

If certifications were a solitary discipline, the Huawei ICT Competition was a step onto a far more public stage.

In 2022, Liao Anjie entered the seventh edition of the competition, choosing the Cloud Track in the Practice Competition. By then, he had invested nearly ten months of focused study in cloud computing and had just earned the HCIE-Cloud Computing certification. That foundation gave him both confidence and technical depth, but he refused to let the certificate become an excuse for complacency.

He approached every mock exam, every architecture design, every team discussion with full commitment. "This competition is not a classroom test—it's a real-world trial," he kept reminding himself.

On May 27, 2023, after six months of effort, he and his teammates stood on the winner's podium of the Huawei ICT Competition Global Final and received the top prize in the Cloud Track. It was his first time on such a luminous international stage—a moment of joy and affirmation that, he says, would remain with him for the rest of his life.

The victory brought confidence, but no sense of completion. He treated it not as an ending but as a new beginning.

For the eighth edition of the competition later that year, Liao chose the Computing Track—a far broader and more technically demanding path that covered openEuler, openGauss, and Kunpeng application development. For him, this meant starting from scratch.

He took on responsibility for his team's Kunpeng development work, setting himself a specific goal: to master the Kunpeng technical ecosystem comprehensively. His method was deliberate: working through every lab task from Huawei's official lab guides, running hands-on experiments step by step, and turning to Kunpeng's official website whenever unfamiliar concepts arose. There was no shortcut—only patience, practice, and steady preparation.The result: another top prize in the Computing Track at the Global Final. But this second triumph was no fluke; it reflected something deeper—the transfer of problem-solving skills, analytical patience, and rigorous methodology from one domain to another.

In 2024, as the ninth edition of the competition approached, Liao prepared for a third challenge: the Ascend AI track, focused on code development. This would be a new technical system to him, with a sharper competitive edge. This time he competed not as a vocational college student but as a newly enrolled undergraduate at Guilin University of Electronic Technology, representing a higher education team.

The shift in track also marked a shift in difficulty. But he did not hesitate. He met the unfamiliar terrain with the same persistence.

Though this time he and his team finished with a global first prize rather than the top honor, he has no regrets. In the 10th Huawei ICT Competition, he competed again in the Ascend AI Track and won the First Prize in the Global Final. Four competitions, four distinct tracks, and no flukes—each one a deliberate test of growth. This last effort, he says, felt less like a contest and more like a measure of how far he had come.

From Focus to Finesse: A Path That Has No Map

Liao Anjie's journey has been one of redefinition. He had been tarred as unremarkable—an average student in an ordinary school, admitted to a vocational college, carrying the invisible weight of labels that rarely open doors. But each step he took rewrote the assumptions others might have made about where his path was destined to lead.

Starting with a personal interest in cloud computing, he ventured into new domains: the technical foundations of computing systems, and, most recently, the demanding world of AI development on the Ascend platform. Each shift not only broadened his technical horizon, but also expanded something more enduring: his ability to face uncertainty, solve complex problems, and chart a voyage where no path is clearly marked.

He often recalls a line from People's Daily:

"Not every effort guarantees success, but every effort plants the seed of fortune."

It was once a promise he made to himself. Now, he offers it to those standing where he once stood; to students wondering if the path of ICT competitions, or any distant ambition, is worth the effort.

"As long as you give everything you have to the pursuit of a goal, the journey itself will have meaning—even if the outcome falls short. But if you give up before you begin, the destination will never draw closer."

Now, Liao Anjie has joined China Telecom. His greatest triumph may not be any single trophy or title. It is the simple, radiant truth that life itself, like skill, is not given—but made.

Bahrain's First Prize Winner of Huawei ICT Competition: From Contestant to IP Engineer Building the Networks of Tomorrow

Early Ambition and Seeds of Success

As a networking student at Bahrain Polytechnic, Mohamed Alkoofi was constantly looking for opportunities to apply his learning beyond the classroom. His early fascination with how information flows across networks inspired him to explore complex networking systems hands-on, experimenting with simulations, test scenarios, and lab environments that mirrored real-world operations. That ambition paved a path few in Bahrain have taken.

Mohamed Alkoofi at the Seeds for the Future

This curiosity led him to Huawei's Seeds for the Future program, where he was the youngest participant. He led his team in the Tech4Good competition to a ranking in the top 5% globally, earning a trip to China. There, he gained exposure to Huawei's R&D center, delved into emerging technologies like 5.5G and early 6G, and observed the culture of innovation at one of the world's leading technology companies.

This experience strengthened his determination to pursue a career in advanced ICT and paved the foundation for his next major challenge: the Huawei ICT Competition.

Huawei ICT Competition: Preparation, Perseverance, and Excellence

The Huawei ICT Competition 2024–2025 Network Track, was a true test of skill, endurance, and teamwork. For Mohamed Alkoofi, it represented the opportunity to demonstrate that Bahrain's youth could compete on the global stage and to validate years of study and preparation.

Preparation was rigorous. He invested countless hours in the lab, designing advanced network scenarios and refining his team's problem-solving strategies. Together, they simulated real-world networks, configuring systems, and overcoming challenges that mirrored those faced by engineers in large-scale deployments.

Beyond technical mastery, he earned his HCIA certification during the regional stage, demonstrating practical competence under pressure. In this way, the preparation itself became a training ground for discipline, teamwork, and innovation, the very qualities the competition sought to recognize.

The global final was an intense, high-stakes environment where precision and collaboration mattered more than ever. His team navigated the complex network topology, solved real-time configuration challenges, and executed cutting-edge technologies flawlessly under tight constraints. Their performance culminated in a first-place victory, making them the first team in Bahrain's history to secure the first place in the Huawei ICT Competition Global Final.

Reflecting on the experience, he notes that the competition did more than test technical skills: It instilled confidence, sharpened problem-solving under pressure, and highlighted the critical importance of innovation, adaptability, and teamwork.

Turning Competition Success into Career Impact

The competition's impact on his career was immediate and transformative. After graduating, he joined Huawei as an apprentice in the Carrier Network Business Group, a role where only the most capable and driven engineers thrive. From the outset, it was clear his value lay not just in his technical knowledge, but the unique confidence and field-readiness he possessed, qualities he attributes directly to the intensity of the ICT Competition.

Within just three months, his performance had already begun to speak for itself. His ability to troubleshoot complex network issues efficiently, implement configurations with precision, apply best practices from high-pressure competition environments, and understand carrier-grade technologies at a practical level distinguished him from his peers. His mentors recognized not only his technical capability but also his reliability, calmness under pressure, and relentless drive to learn.

Recognizing his capability, Huawei offered him a full-time role as an IP Engineer, a rapid and rare progression for a new graduate. Today, he works directly with national service providers and carriers to implement mission-critical network solutions that support major digital services across the region. Whether it's optimizing routing paths, deploying advanced tunneling technologies, or ensuring the reliability of large-scale infrastructure, his work plays a direct role in keeping information flowing across the country. As he describes it: "I don't just use the internet. I help run it."

Mohamed Alkoofi, his teammates, and their instructor standing on the Global Final podium

Mohamed Alkoofi, a Huawei IP engineer in the Middle East Region

He notes that the competition served as the perfect bridge between academic theory and real-world engineering. The simulated environments closely mirrored production network ecosystems, giving him a decisive head start in understanding carrier-grade architectures. These same elements—pressure, teamwork, and precision—became the very qualities demanded of him in the field.

He firmly believes that without the competition's rigorous training and the mindset it instilled, his professional transition would not have been nearly as fast or smooth. Ultimately, the experience did more than prepare him technically; it fundamentally shaped his discipline, leadership, and problem-solving approach, enabling him to excel in one of the most demanding areas of ICT.Looking Ahead: The Competition's Lasting Impact

Mohamed Alkoofi views the Huawei ICT Competition not only as a milestone in his personal journey but also as a powerful platform for aspiring engineers worldwide. In practice, it functions as a dynamic proving ground for three essentials: advanced skill acquisition, innovative problem-solving, and professional opportunity.

Message to future competitors

Invest your time, immerse yourself in learning, trust your team, and embrace every challenge. The Huawei ICT Competition is more than a contest: it is a transformative experience that can shape your career and define your future in ICT.

Huawei ICT Competition 2025-2026:
Three AI Projects that Expand Access to Healthcare and Mobility

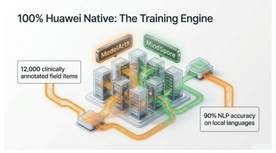

When we talk about AI, the conversation often focuses on automation, productivity, and technological advancement. And themes were very well-represented in the outstanding AI-powered innovations presented by students from around the world at the Huawei ICT Competition Global Final 2025-2026 in Shenzhen.

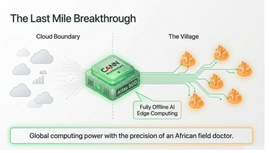

Yet some of the most meaningful innovations were those that could make services, opportunities, and essential resources accessible to people who have traditionally been excluded.

When looking at this year’ s Innovation Competition entries through the TECH4ALL lens and not just as a judge, several entries stood out to me for their potential to improve inclusion: ARE MED Health OS, DermaLens, and TouchBike. While they address very different challenges, they share a common objective: removing barriers that prevent people from participating fully in society.

ARE MED Health OS
Institut National Polytechnique Félix Houphouët-Boigny (INP-HB), Côte d'Ivoire

ARE MED Health OS tackles one of healthcare's most overlooked challenges: communication. The illiteracy rate of Côte d'Ivoire, which is located in West Africa, sits at around 45%, or nearly 15.1 million of its 33.5 million population.

ARE MED Health OS tackles one of healthcare's most overlooked challenges: communication. The illiteracy rate of Côte d'Ivoire, which is located in West Africa, sits at around 45%, or nearly 15.1 million of its 33.5 million population.

Healthcare systems frequently assume that patients can read, write, and communicate comfortably in official languages. In reality, millions of people rely on local dialects and culturally specific expressions to describe symptoms and health concerns. Such is the case in Côte d'Ivoire, which is home to between 70 and 80 dialects. ARE MED Health OS uses Huawei’ s solutions and AI to interpret dialect-specific expressions and bridge the gap between patients and healthcare providers.

Its offline capability extends access to areas where reliable Internet connectivity cannot be guaranteed, while its voice command function via WhatsApp integration makes the solution usable by people with low literacy levels.

By adapting technology to people rather than forcing people to adapt to technology, ARE MED demonstrates a powerful model of inclusive innovation.

DermaLens
Institut Teknologi Bandung, Indonesia

DermaLens focuses on another major barrier: geography. Access to specialist healthcare is often concentrated in urban centres, leaving rural communities underserved.

The platform targets neglected tropical diseases (ntds), which disproportionately affect marginalized, rural populations with poor access to sanitation, clean water, and healthcare.

The solution uses AI-powered skin disease screening to support frontline healthcare workers and enable earlier identification of potential conditions. Rather than replacing clinicians, it acts as a decision-support tool, extending specialist expertise into communities where access may otherwise be limited.

For patients, this can mean faster diagnosis, reduced travel burdens, and improved healthcare outcomes.

TouchBike
IFBA - Instituto Federal de Educação, Ciência e Tecnologia da Bahia, Brazil

TouchBike broadens the conversation beyond healthcare and into mobility. Designed for deaf and hearing-impaired cyclists, the system converts environmental information into tactile and visual feedback. Sensors detect nearby vehicles, obstacles, and important warning sounds, communicating them through vibrations and visual indicators.

The result is a safer and more accessible cycling experience that promotes independence and confidence. Importantly, the benefits may extend beyond the hearing-impaired community, demonstrating how inclusive design often creates value for a much wider audience.

What unites these projects is their focus on people rather than technology. None relies on a breakthrough algorithm alone. Instead, each begins with a real-world barrier and uses technology to reduce or remove it. Language barriers, geographic barriers, and accessibility barriers can all limit participation in society. By addressing these challenges directly, the projects show how innovation can create opportunities for individuals who might otherwise be overlooked.

As artificial intelligence continues to evolve, its true value may lie in its ability to expand access to healthcare, mobility, information, and opportunity. In that sense, inclusion is not simply a social outcome of technology. It is one of its most important measures of success.

Dreams of Coding: Three Young Nigerians' Rise to the Top of Huawei ICT Competition

Under the dazzling spotlight and amid cheers of celebration, three young men from the Federal University of Technology (FUT) in Nigeria stepped onto the podium of the ninth Huawei ICT Competition Global Final. They were Victor Akande, John Olorunsogo, and Wisdom Matthew Urangyork, the winners of the Grand Prize in the Computing Track of the Practice Competition. This moment of glory took root one year ago when they first heard about the Huawei ICT Competition through a roadshow at their campus in Minna.

Three young students from the FUT Minna, Nigeria being awarded the Grand Prize in the Computing Track of the Practice Competition at the ninth Huawei ICT Competition Global Final

A Spark on Campus: Where the Dream Took Shape

In 2024, the Huawei ICT Competition roadshow made its way to the FUT Minna in Nigeria. This event could be held thanks to the Vice Chancellor Professor Faruk Adamu Kuta, who strived to foster an open environment for students to help them pursue their dreams on a bigger stage. For most students, the roadshow was just a normal campus event; but for Victor, John, and Wisdom, it was a chance to set their lives on a new course.

"We were just students curious about technology," Victor recalled. "The roadshow opened our eyes to a bigger world, one where young people from Africa could stand on a global stage and compete with the best." Under the guidance of Engr. Bala Alhaji Salihu (PhD), IT service director and primary leader of the FUT Minna Huawei ICT Academy, the three individuals wasted no time in deciding to form a team and participating in the competition.

Huawei ICT Competition roadshow at the FUT Minna, Nigeria

Forged Through Challenge: Strength Built Through Preparation

Registration was just the first step. The real challenge was to be found in preparation. The Practice Competition Computing Track covered a wide range of cutting-edge technologies, including openEuler operating system, openGauss database management, and Kunpeng architecture. How could they possibly master and apply these technologies in such a short time? The pressure was mounting. Fortunately, with the support from the Huawei ICT Academy administrator Raphael Agboola and the coordinator, the entire preparation process was smooth and they were fully supported at every step.

Over the next few months, the team began a period of focused, high-pressure preparation. Guided by expert instructors from Huawei Nigeria, they took part in advanced training that was a world apart from traditional learning modes. They heard from industry experts, who shared real-world insights and strategic approaches to solving complex computational challenges. The sessions offered more than technical skills. They also provided clear and actionable guidance.

The team soon had a routine, attending training sessions by day and fine-tuning code in the lab by night. As system configurations became more complex, late-night debugging meetings became a daily occurrence. "Those deep-into-the-night meetings pushed our technical skills to a new level. More importantly, they forged our lasting friendships," John said. The experience not only strengthened their technical expertise but also taught them how to work effectively as a team, laying a solid foundation for the competitions ahead.

The Global Stage: Where They Shone Bright

After rigorous selection processes at the national and regional levels, the team emerged from nearly 40,000 registrants and advanced to the Global Final. In May 2025, the three members traveled to Shenzhen, China, to compete on site. "The competition lasted eight hours. It was an ultimate test of technical skill, mental resilience, and teamwork," Wisdom said. "We had to complete complex system design and debugging tasks within a limited timeframe."

Throughout the competition, the team drew deeply on the technical advantages they had accumulated during their preparation. From cluster management and distributed computing to complex service architectures and storage systems, they showed their technical acumen throughout the process. More impressively, they worked outstandingly as a team and remained highly coordinated under pressure.

When the winners were announced at the award ceremony, the three young men embraced in a moment of pure joy. At that moment, they knew every ounce of effort had been worthwhile.

Lessons That Last: Six Principles for Future Success

The competition proved to be a catalyst for the growth of all three team members. During the event, they honed their technical skills and broadened their global outlook. Afterward, they continued to deepen their expertise in ICT, and are now confident about their future career paths.

They also hope to share the lessons learned with other aspiring tech professionals.

First, wholehearted dedication is the bedrock of success. They firmly believe that success never favors those who waver in their commitment. During the long nights and days of preparation, it was this laser-sharp focus that enabled them to overcome one technical challenge after another.

Second, effectively utilizing resources is the key to success. The team particularly emphasized the value of Huawei's online learning platform: "This platform is like a treasure trove. It offers everything from technical documentations and real-world case studies to foundational courses and advanced certifications. All the learning materials we need can be found here."

Third, teamwork is a force multiplier. "When teams work well together, their combined strength far exceeds the sum of individual efforts." Those long nights of working side by side taught them one thing: Strong teamwork brings out the best in everyone.

Fourth, effective communication is what keeps a team running smoothly. They found that clear and frequent communication not only prevents misunderstandings but also keeps everyone moving in the same direction. During the intense preparation for the competition, it played a key role in keeping them on the right track.

Fifth, mentorship is an accelerator of growth. "The guidance from industry experts and instructors has saved us many detours," the team reflected. The insights shared by experienced professionals significantly accelerated their learning and growth.

Sixth, learning is a journey, not a destination. In a world of constant innovation, the real advantage lies in staying curious and never stopping learning.

Passing the Torch: Inspiring the Tech Dream in Africa

The three young innovators have become role models on campus. Their success is proof that in a borderless world of technology, dreams and determination are enough for young minds from Africa to shine on the global stage.

The journey from a Nigerian campus to the stage in Shenzhen is a testament to the true value of the Huawei ICT Competition. It is not only a technical arena but also a bridge connecting dreams with reality. Now, as registration for the tenth Huawei ICT Competition has opened, a new group of students at the Minna Campus is following in their footsteps, ready to write a new chapter in the story of young African tech talent.

As the team put it: "We've shown the world what tech talent from Africa can do. But this is only the beginning." The stage is now set for more students to walk the same path with dream and grit.

A Sustainable Solution at the Huawei ICT Competition: Ghana's Team Eagle Eye Uses AI to Protect Endangered Forests

On the stage of the 9th Huawei ICT Competition Global Final, Team Eagle Eye from the University of Ghana gained recognition from the international judges with their innovative project, Climate Sentinel, an AI and IoT system to provide real-time monitoring and alert systems for Ghana's forest reserves. The innovation not only secured second prize in the competition's innovation track but also earned the event's Green Development Award, highlighting how Africa's young innovators are harnessing technology for global sustainability.

An Idea Takes Shape

Wisdom Nana-Abena Ogbonna, Ryan Nii Akwei Brown, and Jehoaddan Ebrah Andoh are students at the University of Ghana. Their journey with the Huawei ICT Competition began with a campus roadshow. At the time, no one imagined that the event would lead to months of joint preparation and a demanding journey through successive rounds. Through national and regional competitions, they advanced step by step until reaching the Global Final.

After deciding to participate in the Innovation Competition, the team's top priority was to find inspiration. In the AI Innovation track, participants start by identifying real-life needs and combining them with industry application scenarios. They need to use AI, or combine it with other technologies such as cloud computing, IoT, big data, Kunpeng, and HarmonyOS to develop solutions that have both social and commercial value, and design fully functional entries.

Under the guidance of their instructor, Julius Ludu, the team began exploring how technology could address pressing challenges in Ghana. Ryan recalled, "We realized that illegal gold mining and deforestation were urgent problems, and we needed to contribute to tackling them." The idea emerged from the group's brainstorming sessions, where they selected the idea with the greatest social value.

Refining Ideas Through Challenges

During preparation, one of the team's biggest challenges was the lack of proper documentation and support for Huawei Cloud, their primary platform. They accessed the available online resources with minimal video tutorials to guide users. This led to numerous failed configuration attempts, each of which became a learning opportunity.

Over time, the team began relying heavily on Huawei's official documentation, studying examples and gradually piecing together a working solution. This effort eventually resulted in a successful proof of concept. Ryan was most impressed by the range and reliability of tools available on Huawei Cloud. He stated, "Once you understand them, they are powerful and efficient."

With great determination, they managed to develop a forest monitoring system which they named Climate Sentinel. Powered by solar energy, the system embeds IoT sensors and camera modules that can be disguised and deployed within forest reserves. It is capable of detecting human or machine activities and collects images. Supported by Huawei MindSpore, the system processes these images to identify potential threats and issues alerts via text message, email, and PC notifications. At the same time, the captured images are displayed on a web dashboard.

Green Innovation Wins a Moment of Honor

In March 2025, Team Eagle Eye competed in the 9th Huawei ICT Competition regional final at the national HQ, becoming the first team from the University of Ghana to enter the innovation track. They advanced to the Global Final, which was held in May that year, where their remarkable performance during their project presentation and on-site Q&A earned them second prize of the Innovation Competition. In addition, the team attained the competition's sole Green Development Award.

Team Eagle Eye at the venue of the Innovation Competition of the Huawei ICT Competition Global Final

This award was set up because Huawei regards sustainable development as one of its core concepts and has responded to the industry's requirements for green and low-carbon development. Through this award, the competition encouraged participants to use ICT to inject new impetus into environmental protection and social sustainability, promote the green transformation of industries, and build a green and intelligent world.

The Climate Sentinel project was highly suited to this concept. The system provided a low-cost and scalable forest protection solution that can effectively monitor and prevent illegal activity, improve environmental supervision, and assist relevant authorities in making informed decisions to crack down on illegal mining and deforestation. The project directly contributed to multiple sustainable development goals (SDGs), especially SDG 13 (Climate Action) and SDG 15 (Life on Land).

The team was genuinely surprised and deeply honored to receive the award. "We didn't see it coming," Julius shared. "To be recognized in this way means so much to us, our university, and Ghana. It validates the countless hours of effort, collaboration, and learning we've poured into this journey. The award served as a powerful reminder that hard work and dedication don't go unnoticed."

Promoting Learning Through Competition

Over months of competition, the team members flourished. Jehoaddan shared, "This competition helped me grow technically and personally. I've improved in problem-solving, communication, and confidence. Meeting other talented students from around the world and learning from them was also a big gain."

Speaking on the award, the Head of Computer Science Department at the University of Ghana, Prof. Ebenezer Owusu, commended Huawei for organizing the ICT Competition. He said, "The Huawei ICT Competition gave our students the opportunity to demonstrate a collaborative spirit, and build their understanding of the fundamentals of ICT." He then emphasized the significance of the competition in preparing students for the ever-evolving tech industry, stating that it not only helps in sharpening their technical skills but it is also vital in developing critical problem-solving abilities, teamwork, and innovation. Prof. Owusu also expressed his gratitude to Huawei for their continued support in nurturing the next generation of ICT professionals in Ghana and beyond.

ICT in Action: Driving Sustainable Growth

The success of Team Eagle Eye went far beyond a single competition. It became a vivid testament to how vision, perseverance, and collaboration can turn an idea into achievement. From lively discussions in campus hallways to moments of triumph on the international stage, the team showed that with curiosity, resolve, and an open mind, any student can create solutions of real value.

Their innovation has highlighted the link between ICT and a greener future. It shows that technology can connect people while protecting the natural foundations of life.

Now, the 10th Huawei ICT Competition has kicked off and is open for registration. As participants in the journey, Team Eagle Eye hopes more peers will join them in advancing a sustainable future through ongoing innovation in ICT, and together will build a smarter and greener world.

PART4

Huawei ICT Competition 2025-2026 Global Final Awards

Grand Prize

Practice Competition Network Track

University of Science and Technology of Oran

National Higher School of Telecommunications and Information and Communication Technologies - Abdelhafid Boussouf

University of Science and Technology Houari Boumediene

Higher School of Computer Science Sidi Bel Abbes

IFTO - Instituto Federal de Educação, Ciência e Tecnologia do Tocantins
